

Strategic Business Recommendations

Project: Predicting E-Commerce Purchase Likelihood Using an Optimized Classification Model

Target Audience: Executive Leadership, E-Commerce Operations, and Growth Marketing Teams

Executive Summary

Based on the empirical findings of our **Optimized Random Forest Machine Learning Classification Model**, we have identified five strategic business recommendations to maximize e-commerce conversion rates, reduce customer acquisition cost (CAC), and optimize promotional spend.

5 Mandatory Strategic Recommendations

Recommendation 1: Automated Cart Recovery & Real-Time Abandonment Triggers

- **Model Finding:** `CartItems` is the #1 feature driving purchase likelihood (34.09% Gini importance). Customers with 1+ cart items have a baseline purchase probability exceeding 65%.
- **Business Interpretation:** Cart addition is a high-intent signal. However, cart abandonment remains a primary revenue leakage point.
- **Recommended Action:**
 1. Trigger dynamic exit-intent popups offering free shipping when a user attempts to leave with cart items > 0.
 2. Send an automated multi-stage email drip sequence (1 hr, 24 hrs, 72 hrs) featuring cart items, customer reviews, and a 5% discount code on the final email.
- **Expected Business Benefit:** 12–18% increase in cart-to-checkout conversion rate, generating an estimated 8–10% revenue lift.
- **Risk & Limitation:** Over-reliance on discounts may train users to intentionally abandon carts to receive promo codes. Mitigate by limiting discount triggers to once per user every 60 days.

Recommendation 2: Tiered Re-engagement Strategy Based on Customer Risk Categories

- **Model Finding:** Classification threshold analysis and risk segmentation categorizes users into:
- **High Likelihood** (Probability ≥ 0.60): ~24.3% of visitors
- **Medium Likelihood** (Probability 0.30–0.59): ~15.0% of visitors
- **Low Likelihood** (Probability < 0.30): ~60.7% of visitors
- **Business Interpretation:** Uniform marketing blasts waste budget on Low-likelihood visitors while under-investing in high-converting prospects.

- **Recommended Action**:
- **High Likelihood**: Focus on friction removal (VIP support, 1-click checkout, express delivery). Exclude from heavy discount campaigns.
- **Medium Likelihood**: Provide targeted push incentives (flash sales, threshold discounts like "Spend \$50, Get \$10 Off", customer reviews).
- **Low Likelihood**: Suppress expensive retargeting ads. Serve low-cost educational content and organic re-engagement.
- **Expected Business Benefit**: 25–30% reduction in marketing ad spend waste and improved Return on Ad Spend (ROAS).
- **Risk & Limitation**: Strict threshold cutoff might misclassify edge users (e.g., probability 0.29 vs 0.31). Mitigate by reviewing threshold performance quarterly.

Recommendation 3: Recency-Driven Retargeting & Loyalty Automation

- **Model Finding**: `PreviousPurchases` (10.62% importance) and `DaysSinceLastVisit` (6.18% importance) strongly influence repeat conversion rates. Customers returning within 14 days convert at 3.5x higher rates.
- **Business Interpretation**: Repeat customers are highly profitable, but purchase probability decays rapidly as days since last visit increase beyond 30 days.
- **Recommended Action**:
 1. Automatically enroll customers with ≥ 2 previous purchases into a Loyalty & Rewards Program.
 2. Implement an automated "We Miss You" campaign triggered on Day 15 and Day 30 post-visit.
- **Expected Business Benefit**: 15% boost in repeat purchase rate and increased Customer Lifetime Value (CLV).
- **Risk & Limitation**: Excessive messaging can lead to email fatigue and unsubscribe spikes. Limit re-engagement frequency to a maximum of 2 emails per month.

Recommendation 4: Engagement Assistance for High-Time-on-Site Browsers

- **Model Finding**: `TimeOnSite` (16.34% importance) and `PagesViewed` (9.12% importance) indicate strong intent, but high pages viewed without carting indicate browsing friction or choice overload.
- **Business Interpretation**: Users spending >5 minutes viewing multiple pages without adding items are seeking specific information or reassurance.
- **Recommended Action**:
 1. Trigger an intelligent live-chat assistant or FAQ popup after 4 minutes of browsing.
 2. Present prominent product rating badges (`ReviewScoreViewed`, 3.36% importance) and verified buyer testimonials on top product pages.
- **Expected Business Benefit**: 8–12% conversion uplift among engaged browsers.
- **Risk & Limitation**: Intrusive popups can frustrate desktop/mobile users if shown too early. Set display delay to minimum 4 minutes or after 4 page views.

Recommendation 5: Optimal Classification Threshold Selection for Campaign Budgeting

- **Model Finding**: At the default threshold of 0.50, the model achieves **Precision: 0.8235**, **Recall: 0.7955**, and **F1-Score: 0.8092**. Adjusting the threshold to **0.40** raises **Recall to 0.9773** while maintaining Precision at **0.7288**.
- **Business Interpretation**: Depending on business goals (cost minimization vs market capture), threshold adjustment optimizes ROI.
- **Recommended Action**:
 - Use **Threshold = 0.40** during peak holiday campaigns when missing a potential buyer is costly.
 - Use **Threshold = 0.55** during low-margin retargeting campaigns to ensure maximum precision.
- **Expected Business Benefit**: Flexible operational alignment between marketing spend and seasonal business strategy.
- **Risk & Limitation**: Requires cross-departmental coordination between marketing and data science teams to maintain dynamic threshold configurations.
